

What We claim is:

1. A shift actuator for a transmission, which actuates, in a direction of shift, a shift lever for operating a synchronizing
5 device of the transmission, the shift actuator comprising:
a first electromagnetic solenoid and a second
electromagnetic solenoid for actuating an operation member
coupled to said shift lever in the directions opposite to each
other;

10 each of said first electromagnetic solenoid and said
second electromagnetic solenoid comprising a casing, a fixed
iron core disposed in said casing, a moving iron core arranged
to be allowed to approach, and separate away from, said fixed
iron core, an operation rod mounted on said moving iron core
15 to engage with said operation member, and an electromagnetic
coil arranged between said casing and said fixed iron core as
well as said moving iron core,

wherein a stepped protuberance is formed on either one of
the opposing surfaces of said fixed iron core and of said moving
20 iron core, a stepped recess is formed in the other surface to
correspond to said stepped protuberance, and a position at which
an edge of said protuberance and an edge of said recess become
closest to each other is so constituted as to correspond to
the synchronizing position of said synchronizing device.
